

<b>NMRA Technical Note</b>	
<b>Layout Command Control™ (LCC)</b> <b>Function Description Information</b>	
<b>July 22, 2024</b>	<b>TN-9.7.4.8</b>

### **Adopted as a NMRA Technical Note**

The OpenLCB Standard document appended to this cover sheet has been formally adopted as a NMRA Standard by the NMRA Board of Directors on the date shown in the *Adopted* column in the *Version History* table below.

### **Version History**

Date	Adopted	Summary of Changes
July 22, 2024		Initial version submitted for public comment

# Important Notices and Disclaimers Concerning NMRA Standards Documents

The Standards (S), Recommended Practices (RP), Technical Note (TN) and Technical Information (TI) documents of the National Model Railroad Association (“NMRA Standards documents”) are made available for use subject to important notices and legal disclaimers. These notices and disclaimers, or a reference to this page, appear in all standards and may be found under the heading “Important Notices and Disclaimers Concerning NMRA Standards Documents.”

## Notice and Disclaimer of Liability Concerning the Use of NMRA Standards Documents

NMRA Standards documents are developed within the Standards and Conformance Department of the NMRA in association with certain Working Groups, members, and representatives of manufacturers and sellers. NMRA develops its standards through a consensus development process, which brings together volunteers representing varied viewpoints and interests to achieve the final product. NMRA Standards documents are developed by volunteers with modeling, railroading, engineering, and industry-based expertise. Volunteers are not necessarily members of NMRA, and participate without compensation from NMRA.

NMRA does not warrant or represent the accuracy or completeness of the material contained in NMRA Standards documents, and expressly disclaims all warranties (express, implied and statutory) not included in this or any other document relating to the standard or recommended practice, including, but not limited to, the warranties of: merchantability; fitness for a particular purpose; non-infringement; and quality, accuracy, effectiveness, currency, or completeness of material. In addition, NMRA disclaims any and all conditions relating to results and workmanlike effort. In addition, NMRA does not warrant or represent that the use of the material contained in NMRA Standards documents is free from patent infringement. NMRA Standards documents are supplied “AS IS” and “WITH ALL FAULTS.”

Use of NMRA Standards documents is wholly voluntary. The existence of an NMRA Standard or Recommended Practice does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the NMRA Standards documents. Furthermore, the viewpoint expressed at the time that NMRA approves or issues a Standard or Recommended Practice is subject to change brought about through developments in the state of the art and comments received from users of NMRA Standards documents.

In publishing and making its standards available, NMRA is not suggesting or rendering professional or other services for, or on behalf of, any person or entity, nor is NMRA undertaking to perform any duty owed by any other person or entity to another. Any person utilizing any NMRA Standards document, should rely upon their own independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given NMRA Standards documents.

IN NO EVENT SHALL NMRA BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO: THE NEED TO PROCURE SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE PUBLICATION, USE OF, OR RELIANCE UPON ANY STANDARD OR RECOMMENDED PRACTICE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE AND REGARDLESS OF WHETHER SUCH DAMAGE WAS FORESEEABLE.

## Translations

NMRA’s development of NMRA Standards documents involves the review of documents in English only. In the event that an NMRA Standards document is translated, only the English version published by NMRA is the approved NMRA Standards document.

## Official Statements

A statement, written or oral, that is not processed in accordance with NMRA policies for distribution of NMRA communications, or approved by the Board of Directors, an officer or committee chairperson, shall not be considered or inferred to be the official position of NMRA or any of its committees and shall not be considered to be, nor be relied upon as, a formal position of NMRA.

## Comments on Standards

Comments for revision of NMRA Standards documents are welcome from any interested party, regardless of membership. However, **NMRA does not provide interpretations, consulting information, or advice pertaining to NMRA Standards documents.**

Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Since NMRA standards represent a consensus of concerned interests, it is important that any responses to comments and questions also receive the concurrence of a balance of interests. For this reason, NMRA, its departments, Working Groups or committees cannot provide an instant response to comments, or questions except in those cases where the matter has previously been addressed. For the same reason, NMRA does not respond to interpretation requests. Any person who would like to participate in evaluating comments or in revisions to NMRA Standards documents may request participation in the relevant NMRA working group.

## Laws & Regulations

Users of NMRA Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any NMRA Standards document does not constitute compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. NMRA does not, by the publication of NMRA Standards documents, intend to urge action that is not in compliance with applicable laws, and NMRA Standards documents may not be construed as doing so.

## Copyrights

NMRA Standards documents are copyrighted by NMRA under US and international copyright laws. They are made available by NMRA and are adopted for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of modeling, structural and engineering practices and methods. By making NMRA Standards documents available for use and adoption by public authorities and private users, NMRA does not waive any rights in copyright to the NMRA Standards documents.

## IMPORTANT NOTICE

NMRA Standards documents do not guarantee or ensure safety, security, health, or environmental protection, or ensure against interference with or from other systems, devices or networks. NMRA Standards documents development activities consider research and information presented to the standards development group in developing any safety recommendations. Other information about safety practices, changes in technology or technology implementation, or impact by peripheral systems also may be pertinent to safety considerations during implementation of the standard. Implementers and users of NMRA Standards documents are responsible for determining and complying with all appropriate safety, security, environmental, health, and interference protection practices and all applicable laws and regulations.

<b>OpenLCB Technical Note</b>	
<b>Function Description Information</b>	
<b>July 22, 2024</b>	<b>Adopted</b>

## 1 Introduction

"Function Description Information" (FDI) in this context refers to *fixed* information available from an OpenLCB Train Node, via OpenLCB, so that other devices can properly and correctly operate it.

5

Other information may be available via e.g. manuals or the Internet, but the format of that information is not under specification here.

A key use for FDI is to enable an OpenLCB throttle to determine the features provided by a Train Node's functions. The throttle will use the FDI information to render some form of suitable Graphical User Interface to allow the user to easily and intuitively operate the functions provided by the Train Node

10

An important design choice was to embed the FDI into each node so that the system has all it needs to operate the Train Node without having to source the information externally to the OpenLCB network from the manufacturer or some other on-line repository via the Internet or a CD/DVD etc. An OpenLCB throttle is not required to have an Internet connection.

15

### 1.1 Requirements

20

- Train Nodes must carry enough context that a stand-alone throttle can provide a useful human interface without getting any data from an external source, e.g. needing an Internet download or the user entering or uploading a database.

### 1.2 Preferences

25

- Train Nodes shouldn't need a lot of processing power, e.g. to compress or decompress data in real time. Memory usage should also be limited, but is a second priority.
- The necessary OpenLCB operations should be state-less and idempotent to simplify software at both ends.

## 2 Annotations to the Standard

### 2.1 Introduction

Note that this section of the Standard is informative, not normative.

30

The concept and interaction are using the same pattern and similar format as the Configuration Description Information, purposefully, with the expectation that OpenLCB devices will be able to share the software implementation between these two use-cases.

## 2.2 Intended Use

35 Note that this section of the Standard is informative, not normative.

The most important use-case of operating a model train is controlling speed and functions. The protocol for these are defined in the OpenLCB Train Control protocol Standard. The user typically uses a Throttle for performing these operations, either as a special-purpose hardware device, or as a software function on a generic computing device.

40 While the semantic meaning of speed control is very well defined, the meaning of functions is left very vague by the OpenLCB Train Control standard, just like other standards of the industry; a function is some form of remote controlled feature of the train (or locomotive). This vague definition is intentional, as manufacturers have come up with new and innovative ideas on what kind of additional features they want to add to their models, and the typical way to operate these features is using the  
45 function abstraction.

Typical functions are lighting functions (like headlights, tail lights, class marker lights, etc.), motor control functions (momentum, braking, etc.), sound functions (horn, bell, whistle, engine sounds, compressor, etc.) and a variety of other functions, such as a smoke unit, raising and lowering a pantograph or operating a locomotive-mounted remote uncoupler. There is no definitive list of all  
50 possible functions. The TN-218 document by RailCommunity lists over 120 different types.

Not only is the list of possibilities is very large, one specific model alone can carry dozens of different functions. Users of proprietary throttles have to activate these typically by their function number, for example using a numeric keypad. This is easy to operate, provided that the user has memorized which function number does what on that specific locomotive. With dozens of functions per locomotive and  
55 up to hundreds of locomotives on a big layout, this is no easy task. As such, it is an important use-case for the OpenLCB Throttle to display a user interface that provides information to the user about what function numbers are available, and which numbers perform what operations on the train.

The Function Description Information (FDI) provides exactly this metadata for the throttle: the list of functions, for each function the number at which it is accessible, and a textual description of what the  
60 given function does.

In addition to the description for the user, the throttle user interface needs some additional metadata to determine how the particular function button should behave. There are two common behaviors for on/off functions: *momentary* functions are turned on while the user is holding the button, and turned off upon release. *Toggle* (or binary) functions are turned on with a press of the button, then they stay on  
65 after release, until the user presses the button again. A typical momentary function is horn, a typical toggle function is headlight. This is purely a behavior of the user interface, as the underlying protocol for turning the function on and off is the same for both cases. *Analog* functions, such as a horn volume or pitch, take a numerical value to control their operation.

## 2.3 Reference and Context

- 70 The Memory Configuration Protocol is one way to retrieve the FDI, but FDI is independent of that. Download of this data via a direct BLE transfer offering a similar capability would make this specification equally applicable.

## 2.4 Content

- 75 The function description information for a Train Node is invariant while the node has any OpenLCB connections in the Initialized state. The Train Node's transition back to Initialized state via sending an Initialization Complete global message tells other nodes to flush their caches and pick up any changed content.

- 80 There are no default values that e.g. associate "Bell" with a particular location or function. These are thought to be too brittle, and there are just too many possibilities to be useful.

## 2.5 Format

The structure is somewhat similar to the Configuration Definition Information structure, with named sections that organize and describe individual items.

The use of XML 1.0 format is intended to make the content as easy as possible to parse.

- 85 The use of XML Schema 1.0 is intended to allow the use of common XML parsers. Note that the schema definition file includes an XML Schema 1.1 check for extensibility that has been commented out so that the operational schema remains valid Schema 1.0.

### 2.5.1 XML Elements

- 90 Note that nothing in the Standard prevents providing an xml-stylesheet instruction, and it's common to provide one of the form:

```
<?xml-stylesheet type='text/xsl' href='xslt/fdi.xsl'?>
```

#### 2.5.1.1 <fdi> Element

- 95 The <fdi> element forms the root of the document. It provides the "xmlns:xsi" and "xsi:noNamespaceSchemaLocation" attributes that define the schema for automated processing.

#### 2.5.1.2 <segment> Element

- 100 The <segment> element is provided for future extensibility. The "space" and "origin" attributes are carried over from the Configuration Description Information format, but at the present state of the standard, there is no way to express a different memory space than 0xF9. Similarly, the layout of offsets in the memory space is not defined today. If a future version of this standard provides such capabilities, then the "space" and "origin" attributes may be used in a backwards-compatible way, with 0xF9 and 0 being their respective defaults. They should be omitted in current implementations.

### 2.5.1.3 <group> Element

105 Groups may contain one or more inner groups, with the same representation. This may continue to any desired level.

Note that unlike in the CDI standard, groups can not be specified with a repetition count in the FDI. The reason for this is that individual functions are addressed by the <number> sub-element, and repeating a group is not meaningful, because that sub-element would remain the same.

### 2.5.1.4 <function> Element

110 The “kind” attribute is an enumerated type of (currently) "binary", “momentary”, and "analog".

The “number” element indicates which function is being described by this element. This value is to be used in the Train Control Protocol Set Function operation in the "address" field. That field is 24 bits, therefore the maximum value in this element is 16777215.

115 Note that there is no requirement on the ordering of the <function> elements with respect to their <number>. It is not required for functions to be listed in ascending order by number, and it is not required for every function number in a range to be present (i.e., numbers can be skipped). A function number not listed in the FDI is assumed by throttles to be doing nothing (i.e., not presented on a UI having a list of functions).

120 The “name” element provides information which can be used if the throttle has e.g. a graphical interface to the user.

The “size” attribute is optionally allowed for compatibility with some early, pre-Standard implementations. It should be omitted in current and future implementations.

## 3 Additional Information

### 125 3.1 Design points

Basic configuration is done with the [configuration protocol](#) defined elsewhere.

130 Function values are stored in the 0xF9 memory space. They can be addressed through the Train Control protocol’s Set Function and Query Function commands. The Memory Configuration Protocol can also be used to read and write the memory space 0xF9, if that is implemented. This allows reading a large number of functions with a single request. However, while the Train Control Protocol Set Function has 16 bits available to represent a function's value, in the memory space 0xF9 there is only 1 byte per function address; the default value of deprecated attribute 'size' being 1 represents this. There is no resolution for this discrepancy in the current Standard.

### 135 3.2 Sample Function Definition XML:

```
<?xml version='1.0' encoding='UTF-8'?>
<?xml-stylesheet type='text/xsl' href='xslt/fdi.xsl'?>
<fdi xmlns:xsi='http://www.w3.org/2001/XMLSchema-instance'
xsi:noNamespaceSchemaLocation='https://openlcb.org/schema/fdi/1/0/fdi.xsd'>
```

```
140 <segment>
    <group>
      <name>Lighting Functions</name>
      <description>Headlights and Marker lights and Running lights, oh my.</description>
145 <function kind="binary">
      <name>Headlights</name>
      <number>0</number>
    </function>
    <function>
150 <name>Ditch Lights</name>
      <number>4</number>
    </function>
  </group>
  <group>
155 <name>Sound Functions</name>
      <description>Toot toot!</description>
      <function kind="analog">
        <name>Horn</name>
        <number>8</number>
160 <min>0</min>
        <max>2</max>
      </function>
    </group>
  </segment>
165 </fdi>
```

### 3.3 Sample Older Implementation

170 A sample older implementation of the DCC F0-F28 functions, with some optional attributes still in place:

```

175 <?xml version='1.0' encoding='UTF-8'?>
    <?xml-stylesheet type='text/xsl' href='xslt/fdi.xsl'?>
    <fdi xmlns:xsi='http://www.w3.org/2001/XMLSchema-instance'
      xsi:noNamespaceSchemaLocation='https://openlcb.org/schema/fdi/1/0/fdi.xsd'>
180   <segment origin='0' space='249'>
     <group>
      <name>F0-F28</name>
      <description>Standard DCC functions</description>
      <function size="1" kind="binary">
185       <name>Headlight</name>
        <number>0</number>
      </function>
      <function size="1">
        <number>1</number>
190     </function>
      ...
      <function size="1">
        <number>28</number>
      </function>
    </group>
  </segment>
</fdi>

```

## 195 4 Possible Future Work

This section discusses some areas where future work may be desired. It is meant as a record of the discussions to date, not as defining any specific solution(s).

### 4.1 Data Compression

200 Some work has gone into XML content compression for the Configuration Description Information (CDI) data. See the CDI Technical Note for various considerations that have been discussed. A solution there, if developed, standardized and deployed, could also be used here.

205 The function definition information is expected to be significantly smaller than a Train Node's CDI, so there may be less need to compress the FDI. On the other hand, CDI gets retrieved relatively rarely (only when a user intends to modify configuration), whereas FDI gets retrieved regularly as part of normal operations of a model railroad.

### 4.2 Internationalization of the Content

Not everybody runs their trains in English.

The xml:lang attribute could be used to define versions of the <name> and <description> elements that use an alternate language.<sup>1</sup> This approach can greatly increase the size of the XML content if the internationalization effort is very successful. On the other hand, it's transparent to XML-using nodes that don't implement internationalization.

### 4.3 Machine-readable function classification

Currently the function's type is expressed in a free-text form in the <name> element. This has a wide expressibility, but presents challenges for user interface development:

- Text generally needs to be rendered with a font size that is readable for the given user.
- Long text takes a significant amount of screen real-estate.
- Text display assumes the user can read, which excludes children under a certain age.

Instead of this, a variety of competing model railroad systems define function types which are then represented by appropriate icons. The icons can be standardized in size, and convey significantly more information on a given real estate than text. This limits the user's choice (there is a fixed number of different icons provided by the implementation usually), but a larger number of functions will fit on the user interface than in a text version.

In order to add machine-readable function type, we need two things:

- An enumeration that lists possible function types and assigns numbers to them. There is such a list in TN-218 by RailCommunity.
- An attribute or element for transmitting the function enumeration in the FDI.
